About NiCE

With NiCE, it's never been easier for organizations of all sizes around the globe to create extraordinary customer experiences while meeting key business metrics. Featuring the world's #1 cloud-native customer experience (CX) platform, CXone, NiCE is a worldwide leader in AI-powered self-service and agent-assisted CX software for the contact center — and beyond. Over 25,000 organizations in more than 150 countries, including over 85 of the Fortune 100 companies, partner with NiCE to transform — and elevate — every customer interaction.

IN THIS CHAPTER

- Explaining AI agents
- Working alongside humans
- Needing smarter agents for modern CX

Chapter 1
Defining AI Agents and Why You Need Them

Everyone uses artificial intelligence (AI) in some way. From direct access to one of the popular generative AI (GenAI) models to indirect access through AI-assisted tech, AI isn't just the future; it's the present. Today, organizations want to include AI in ways that make sense. But deploying AI within many companies is clouded by numerous unknowns.

When it comes to the customer experience (CX), one of the use cases for AI is clear: Enhanced and assisted customer interaction capabilities. But there are more uses for AI than a direct interaction. Adding AI agents within your entire CX organization greatly improves visibility and provides value to your customers, supervisors, and organization. This chapter examines how AI agents can be included to improve CX and provide value to your organization.

Understanding AI Agents

When it comes to customer service, an AI agent is an intelligent system that interacts with your customers or customer service representatives to resolve issues and improve the overall CX. AI

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

agents perceive customer needs and can take action across multiple systems on behalf of the customer and support representatives. As the next level in CX, an AI agent interacts with customers and customer service representatives to tailor the needs of the customer into actions and, ultimately, into a solution for the customer.

This section looks at AI agents in depth, providing an introduction to how they work to enhance the modern CX.

Seeing what an AI agent does

An AI agent understands the context of the conversation and can act beyond the limited script given to a chatbot. AI agents also help customer service representatives and provide automation and assistance within your existing workflows and operations. Their top core functions include

- **Data consumption:** Continuously consuming and processing data from multiple sources with a focus on interaction improvement
- **Proactive engagement:** Connecting with customers across multiple channels and anticipating their needs
- **Action execution:** Obtaining customer intent from the conversation and, through backend integration, performing actions like account or record updates and transaction processing

AI agents can also help in other areas of your business. An AI agent leverages your existing data to provide new insights. When used in this way, an AI agent helps streamline work and increase overall pace of innovation within your business.

Knowing how an AI agent works

AI agents proactively or reactively predict and address the needs of both customers and customer service representatives. AI agents integrate knowledge, tools, and systems within your organization to provide an interconnected experience. A comprehensive AI agent includes the ability to execute complex workflows by using data and decision-making from your organization itself.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

Empowering Humans Instead of Replacing Them

AI agents ensure accuracy with human-in-the-loop processing. By using past experience and data from your organization, AI agents support and enhance your existing customer service operations. An AI agent is trained on your data and meant to assist humans and enhance the human element within the overall CX.

Differentiating an AI agent from GenAI

An AI agent isn't GenAI. The premise behind GenAI is to come up with open-ended and creative solutions to just about any prompts from the user. While guardrails exist with commercially available GenAI services, content can be essentially created from scratch with GenAI.

An AI agent, by contrast, is a goal-driven AI system that works within your existing operations — following your rules toward specific business outcomes. The end result is an agentic experience that performs tasks and activities that would otherwise be done manually. The term *agentic* refers to systems capable of independent action based on intent, context, and goals — like a human agent.

Seeing what differs between AI agents and bots for CX

Contrasting GenAI with an AI agent, an AI agent is meant to provide personal responses with smarter, contextual meaning and relevance. AI agents go well beyond chatbots for providing agentic customer service but still fit within the desired and directed experience from your organization. An AI agent won't come up with creative responses; it merely enhances the CX.

REMEMBER

Traditional chatbots are completely scripted and limited by that script. If a customer needs something outside of the script, the chatbot simply can't provide it. The customer then needs to switch to an agent for the remainder of that interaction. Customers also limit their responses to what they believe the chatbot will understand. An AI agent mirrors the human experience more closely, providing a more authentic and helpful experience for the customer.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

Rationalizing Why Modern CX Needs Smarter AI Agents

Modern CX goes well beyond simply responding to customer inquiries. Integration of AI helps to solve problems that your organization may not even know it has. By connecting multiple systems and providing insights that aren't always visible, AI can increase both customer satisfaction while decreasing call volume and handle time. Modern CX needs automation and analytics to find solutions and monitor effectiveness, quality, and compliance.

Helping to solve problems

A modern CX operates through multiple channels, both proactively and reactively working with customers. AI agents can streamline processes involving customers and backend operations. AI agents reduce customer wait times and streamline backend workflows through smart automation with the specific needs of the organization in mind. These benefits are created in a trusted environment using the organization's own data. Data is kept private because the AI agent is operated internally.

Providing advanced analytics

WARNING

One of the biggest challenges with CX analytics is the sheer amount of data from disparate data sources. That data is often unstructured but needs to be analyzed alongside other data which is structured. AI agents can aggregate, process, and analyze both structured and unstructured data from across your CX ecosystem. Make sure to analyze 100 percent of interactions across platforms to identify trends and overall performance within CX.

Integration of AI helps solve problems within a modern organization. This integration can also connect business intelligence (BI) platforms. BI platform integration helps with decision velocity, connecting the dots between areas of your business.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

IN THIS CHAPTER

- Assisting both customers and your business
- Helping employees directly
- Creating a unified AI solution
- Looking at AI agent case studies

Chapter 2
Making the Business Case for AI Agents

An artificial intelligence (AI) agent is a goal-oriented system that uses technologies like machine learning (ML), natural language processing (NLP), and automation to support customer interactions and internal operations. While all agentic AI agents are AI agents, not all AI agents are agentic. Some may be rule-based or generative without the autonomy to act independently. Agentic AI agents, by contrast, are designed to operate autonomously and take initiative toward complex goals — resolving issues across systems, making decisions, and following up with customers without human intervention.

AI agents that leverage agentic AI can significantly elevate both customer experience (CX) and operational efficiency. They provide real-time assistance, deliver predictive insights, and adapt based on context — giving your organization a meaningful competitive edge. This chapter explores how AI agents can unlock new potential for CX and business outcomes, with two real-world case studies of successful deployments.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

Helping Customers and the Business

With a focus on CX, AI agents provide specific and powerful improvements for customers, meaningful self-service, and quicker, easier solutions that help solve customer issues without human intervention. Making customers happy has benefits for your business. But how exactly does an AI agent help?

Customers today are tired of interacting with chatbots and interactive voice response systems that don't understand their needs or drive them in circles through endless prompts. Instead, customers want a seamless experience that quickly and efficiently helps them complete tasks.

With a dynamic, personalized, and proactive conversation, agentic AI drives an improved CX. Customers no longer need to escalate because the AI, acting autonomously, resolves the issue. From the perspective of the customer, the issue is simply resolved without the friction that they may have encountered with a legacy chatbot system.

REMEMBER

AI chatbots are like conversational flows and scripted bots, whereas AI agents can be agentic and goal-orientated bots. On the surface, AI agents and chatbots are similar, but, under the hood, they're built completely differently.

Assisting Employees

Beyond direct assistance to customers and automated assistance for agents while interacting with customers, AI can also assist your employees in the following ways:

- AI agents help human agents perform their jobs more efficiently to reduce handle time. A reduction in handle time results in the following:
  - Smoother customer experiences
  - Easier CX with shorter hold times
  - Enhanced productivity for your organization
- When a human agent is involved, an AI agent provides direct assistance to that agent, anticipating needs and delivering assistance based on real-time intent detection.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

» Leveraging AI solutions can reduce manual processes, which leads directly to productivity gains, such as

- Automating interaction summaries that capture not just the transcription but also the sentiment behind each interaction
- Determining customer sentiment throughout interactions and providing insights into common reasons why customers are contacting your organization
- Identifying issues with products and services by using advanced analytics through AI
- Identifying areas of additional training for representatives

Building a Unified Solution

Multiple deployments of AI solutions throughout an organization can lead to significant fragmentation. Solutions may work well within their silo but are incapable of sharing data, making it difficult to get a clear picture of the organization. Unifying AI solutions and integrating those solutions into other systems provides direct and tangible gains to your organization.

Sharing data with BI systems

Many organizations already have existing business intelligence (BI) systems in place. These systems analyze huge amounts of data. Deploying a new solution, especially one as critical as agentic AI agent, should include methods for integration with existing BI and data stores. Ideally, AI solutions offer open application programming interfaces (APIs) to enable seamless integration with existing tools, data sources, and workflows — all are crucial for handling complex enterprise scenarios.

Training predictive models

With data available from other systems and new data being created all the time, you must continue training AI systems. For example, transcripts of interactions can be used as input to continuously improve future interactions. As more and more data is used for training, predictions around interactions and customer sentiment become more accurate. Rather than being pinned to a

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

particular solution, the newly trained model is able to more accurately help customers based on changing products and services.

Seeing AI Agents in Action

Using AI for customer service is something you want now. Companies are already deploying AI solutions. This section gives you two examples.

Carnival

Carnival UK operates popular cruise lines with 1.2 million customer interactions per year handled by 300 agents and 100 supervisory staff. It deploys integrated AI CX solutions to help improve the CX while also optimizing cost and gaining insight into its customers and interactions. Prior to the deployment of AI technologies, Carnival UK relied on manual transcriptions for voice interactions.

The value proposition for Carnival was to deploy an integrated solution that enabled visibility across contact channels. The pilot validated the core functionality while also helping to train and learn about the solution. By using assisted interactions between AI and agents, Carnival UK converted the data and captured insights. The key takeaways were sentiment analysis through a dashboard and the ability to analyze numerous interactions.

Sony

Sony Electronics is a leader in consumer and professional electronics and a subsidiary of Sony Corporation of America. Sony Electronics has 700 agents providing sales and support for consumers and professionals. It wanted to streamline its customer service pipeline to provide more information to agents earlier in the process. Accomplishing this goal meant incorporating AI to analyze 60,000 previous interactions. This analysis led to improvements in customer self-service. Through the analysis, Sony Electronics learned that 40 percent of inquiries could be handled through automation. By applying additional AI technologies, the company focused efforts on automating the interactions that deliver the highest return on investment (ROI).

IN THIS CHAPTER

- Diving into CXone Mpower
- Seeing how self-service, proactive actions, and interactive actions work with CXone Mpower

Chapter 3
Meeting the Agents

Customer experience (CX) can make or break customer loyalty. With brand loyalty being increasingly challenging across industries, the ability to add value to the customer without increasing operational costs is more important than ever.

NiCE's CXone Mpower solution combines multiple artificial intelligence (AI)-powered tools with a single goal: to improve the CX. This chapter provides more detail on CXone Mpower, including Autopilot, Proactive AI Agent, Copilot for Agents, and Actions.

Looking at CXone Mpower

CXone Mpower is a unified CX-aware AI platform with the ability to drive CX to the next level. Leveraging a blend of purpose-built deterministic AI models, generative AI, and agentic systems, the platform brings high value across multiple roles within your organization.

Going to the next-level with AI

AI, like that used in CXone Mpower, can handle customer interactions in ways that go far beyond a scripted bot. For example, Autopilot and Proactive AI Agents use past interactions and

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

customer context to determine next-best actions, enabling real-time, personalized support across channels.

AI helps agents, too. AI determines the next action needed by using past interactions as a guide to perform activities and provide responses in real time. As more and more interactions are recorded, the deep memory of the large language model (LLM) continues to expand. Customer effort is reduced because the system is able to resume interactions across channels. This means that the value of the system only increases over time.

Integrating data for the best CX

All the data from multiple CX systems can be integrated into CXone Mpower. This information includes both metadata and the data itself. Integration at this level enables a holistic picture of customer preferences, including their previous interactions. The end result is a much more personalized experience for the customer.

TECHNICAL STUFF

Metadata is simply data about data or things that describe the data.

Defining deterministic AI for agents and customers

GenAI sometimes provides different outcomes for the same prompts, which can be a real problem when consistency is required. That's where deterministic AI comes in. *Deterministic AI* is an AI system that provides the same output from the same prompt. In this way, your organization knows that given the same prompt from a customer, the AI will provide the same solution.

CXone Mpower has over 30 industry-specific agents available. This significantly decreases the implementation time and enables your business to obtain value much faster.

Listing the Features of CXone Mpower

Helping customers help themselves is a common goal among automated CX systems. Beyond customer self-service, CXone Mpower can also proactively help customers and provide real-time assistance for customer service agents. This section looks at these exciting aspects of the solution.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

CXone Mpower Autopilot and Proactive AI Agent

With CXone Mpower Autopilot, customers use a self-service model with context awareness that guides them toward solutions. Workflow automation is built in, so the solution can take actions on behalf of the customer when needed. This results in decreased call center volume and operational costs.

Helping customers proactively

Customer-facing AI agents aren't just limited to reactive self-service. Proactive AI Agent can reach out to customers or prospects based on custom data triggers, conducting dynamically adapted conversations over voice or text that guide them toward optimal outcomes like acquiring new customers or avoiding costly events like missed appointments. In context, this engagement adds significant value to the customer while also reducing operational costs.

Using AI guardrails for precision responses

Interactions can be both consistent and accurate with guardrails around the responses generated by AI. You can trust that responses will be consistent and complete, thanks to training on your internal knowledge base and integrated guardrails. All of this is available across the varied digital channels used by modern CX.

CXone Mpower Copilot for Agents

CXone Mpower Copilot for Agents leverages AI that's tailored specifically for the interaction. This is not simply GenAI providing generic responses, but it's a true real-time assistant for agents. Information is domain-specific and customized to meet organizational directives and goals for customer interactions. Newly onboarded agents become CX veterans much faster with contextual real-time help during the interaction.

TIP

And AutoSummary, a feature within Copilot, summarizes the conversation within customer notes, saving the agent from having to write a summary.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

CXone Mpower Actions

CXone Mpower Actions delivers real-time insights and automation for any user across the CX organization. Actions turns data into actionable insights that empower immediate decisions — helping users respond to performance trends, compliance issues, or customer sentiment changes without manual intervention. Through real-time data analysis, CXone Mpower Actions enables organizations to execute timely improvements and scale intelligent decisions across teams.

REMEMBER

AI agents for CX can score interactions on a variety of compliance and performance criteria, including soft skills like empathy and professionalism.

Getting the analytics

Leaders need information in order to monitor and improve operations. When that information is timely and actionable, high-value improvements can then be targeted first. CXone Mpower Actions pulls from the entire CXone Mpower platform to deliver high-value, real-time analytics when and where leaders need them most.

Turning analytics into actions

Analytics alone isn't enough to drive great CX — you need clear, actionable insights. CXone Mpower Actions helps you unlock data-driven intelligence by structuring unstructured data and highlighting the best paths to resolution. It empowers users to act quickly and efficiently, offering clear direction on what to do next — without requiring coding or complex tools. With Actions, you can benchmark service levels, uncover new opportunities, and observe the performance of your AI solutions, turning insights into smarter decisions at scale.

IN THIS CHAPTER

- Improving CX with agentic AI
- Helping employees through agentic AI
- Assisting business leaders

Chapter 4
Ten Benefits of Deploying AI Agents for CX

AI agents represent the next evolution of artificial intelligence (AI) in the enterprise. In customer experience (CX), agentic AI agents unlock the next level of performance and personalization.

TIP

Deploying agentic AI for CX can benefit your business in many ways:

- **Improve the CX.** Agentic AI agents help deliver faster, smarter, and more seamless customer interactions. It reduces friction and enables more proactive service, leading to lower costs and happier customers. Check out Chapter 2 for more.
- **Get a dedicated AI platform for CX.** With AI tailored specifically for CX, your organization benefits from customized models, CX-specific guardrails, and consistent responses for both agents and customers. Dive further into this benefit in Chapter 1.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

- **Automate tedious tasks.** From call transcriptions to backend workflows, agentic AI eliminates manual tasks for agents and supervisors, freeing them up to focus on high-value interactions. Chapter 2 highlights how dedicated AI for CX can help with task automation.
- **Enhance data privacy.** AI agents are trained on your internal data, keeping it private and secure, but public AI models may use shared datasets in unpredictable ways.
- **Reduce onboarding time.** New agents ramp up faster with AI assistants trained on your organization's processes and best practices. Real-time guidance helps them deliver quality service from day one. See Chapter 2 for more details on this feature.
- **Evolve the human role for agents.** AI agents enable human agents to focus on more complex or personalized customer needs. This evolution can transform the human agents' roles from script readers to strategic problem-solvers.
- **Empower supervisors to focus on what matters.** With automated insights into performance, compliance, and customer sentiment, supervisors can shift their attention to coaching, strategy, and high-impact improvements.
- **Improve productivity.** Whether it's auto-summarizing conversations or surfacing next-best actions, AI agents enhance day-to-day productivity for human agents and supervisors alike. See Chapter 2 for more details.
- **Be proactive instead of reactive.** AI agents can help customers by anticipating their needs. By using past interactions as training data, the AI agent is proactive rather than reactive and can even act on behalf of human agents (more in Chapter 1).
- **Enable real-time copilot assistance.** AI Copilot assists agents in real time with contextual responses, knowledge of surfacing, and automation, which help them deliver faster and more accurate resolutions. Chapter 3 covers AI Copilot.

REMEMBER

AI agents aren't just a trend; they're a transformational approach to customer service. By deploying AI agents across your CX ecosystem, your organization can drive better outcomes for customers, employees, and the business as a whole. The time to act is now.

These materials are © 2026 John Wiley & Sons, Inc. Any dissemination, distribution, or unauthorized use is strictly prohibited.

Unlock the power of AI agents

AI agents are redefining customer experience (CX) — and it's happening now. This book breaks down what AI agents are, how they work, and the most effective ways to apply them in CX. Find out how NiCE's CXone Mpower platform powers Autopilot, Copilot, and Proactive AI Agents to deliver smarter, faster, and more empathetic service. See how leading brands are already achieving powerful outcomes with AI agents today.

Inside...

- Understand the role of AI agents
- Meet Autopilot, Copilot, and more
- Learn how CXone Mpower works
- Explore real-life business outcomes
- Build a case for AI in CX
- Overcome adoption barriers fast
- Future-proof your service strategy
